RESEARCH PROFILE

MSc AI researcher (thesis grade 1.0, Excellent) specializing in Multi-Agent Reinforcement Learning and structured robot/agent learning. Core expertise centers on cooperative MARL under partial observability, structure-aware policy learning, and zero-shot generalization across unseen deployment environments. Developed GatConvo, a Graph-Attention MARL framework for cooperative autonomous driving, submitted to IEEE Transactions on Intelligent Transportation Systems. Complementary work in neuro-symbolic reasoning (VedaNet) and LLM evaluation (SanskritEval) reflects a consistent focus on interpretable, grounded AI systems aligned with PEARL Lab's vision of composable, adaptive, and robust agent behaviors.

EDUCATION

SRH University of Applied Sciences, Berlin, Germany Oct 2023 to Sep 2025
MSc in Big Data and Artificial Intelligence | Final Grade: 2.0 | Thesis Grade: 1.0 (Excellent)

- Thesis: Coordinated Multi-Agent Reinforcement Learning for Autonomous Driving in Mixed-Traffic Environments
- Supervisor: Prof. Dr. Alexander Iliev | Submitted to IEEE Transactions on Intelligent Transportation Systems
- Coursework: Reinforcement Learning, Machine Learning, Probability and Optimization, Data Mining

Global Academy of Technology, Bengaluru, India Aug 2018 to Aug 2022
BE in Information Science and Engineering | Grade: 7.71/10

- Thesis: Crowd Density Estimation and Location Prediction in Public Transport Systems
- Published in IJERT and IJIRT, 2022. Applied LSTM, ARIMA, CNN, XGBoost with structured cross-model evaluation.

RESEARCH AND ACADEMIC EXPERIENCE

Master's Thesis Research, SRH Berlin Mar 2025 to Sep 2025
Coordinated Multi-Agent RL for Autonomous Driving | Supervisor: Prof. Dr. Alexander Iliev

- Designed GatConvo, a graph-attention multi-agent coordination framework for partially observable mixed-traffic environments; agents fuse positional, velocity, and intent signals via graph-attention message passing.
- Implemented zero-shot cross-scenario transfer evaluation across five unseen traffic scenarios without additional fine-tuning, demonstrating structure-aware generalization beyond training distribution.
- Developed explainability modules to diagnose agent decision-making under distribution shift and partial observability; analyzed long-term coordination stability under varying traffic densities and communication constraints.
- Results submitted to IEEE Transactions on Intelligent Transportation Systems (under review, 2025).

Research Internship, SRH Berlin Oct 2024 to Mar 2025
Enabling AI to Understand and Process Abstract Concepts | Supervisor: Prof. Dr. Alexander Iliev

- Investigated symbolic reasoning and structured embedding representations for abstract concept grounding; designed controlled benchmarks isolating structural generalization from surface memorization.

Bachelor's Thesis Research, Global Academy of Technology Aug 2021 to Aug 2022
Crowd Density Estimation and Location Prediction | Supervisor: Dr. Deepthi V.S.

- Applied and compared ML algorithms (LSTM, ARIMA, CNN, XGBoost) for travel-time forecasting with structured cross-model evaluation and error analysis. Published in IJERT, 2022.

RESEARCH PROJECTS

GatConvo: Graph-Attention MARL for Cooperative Autonomous Driving 2025
PyTorch, Graph Attention Networks, SUMO, Multi-Agent RL

- Designed distributed multi-agent coordination framework with partial observability; graph-attention message passing aggregates heterogeneous neighbor observations to produce cooperative joint policies.
- Zero-shot transfer protocol evaluates policy generalization across unseen traffic densities and junction topologies; explainability diagnostics surface agent failure modes under distribution shift.
- Submitted to IEEE Transactions on Intelligent Transportation Systems.

VedaNet: Neuro-Symbolic Reasoning Framework (Ongoing) 2024 to Present
Python, Hugging Face, Symbolic Constraint Layers

- Designing a five-layer pipeline integrating structured logical constraints as symbolic inductive biases into LLM inference: Chitta, Shabda, Sat, Viveka, and Generation layers.
- Formalizes Vedic epistemic principles as composable constraint modules; targets EMNLP 2026. Directly relevant to PEARL Lab's grounded world model and structured representation research.

SanskritEval: Structural Generalization Benchmark for LLMs 2024
Python, Hugging Face Transformers, Contrast-Set Benchmarking

- Designed distribution-shift benchmark with rule-type and paradigm holdout splits to distinguish structural learning from surface co-occurrence memorization. Built end-to-end pipeline with over 701 annotated samples.
- Implemented pseudo-likelihood scoring, probing classifiers, and attention diagnostics; evaluation methodology is domain-agnostic and transferable to structured robot perception tasks.

RAG-Guard: Adversarial Defense for LLM Retrieval Pipelines 2024
Python, SQuAD v2, LangChain, Statistical Anomaly Detection

- Developed Adaptive Semantic Density Filtering (ASDF), a statistical pruning algorithm using Euclidean distance distribution to remove adversarial retrieval contexts at inference time.
- Eliminated all PII exfiltration in red-team simulations versus 80% baseline failure rate.

Hierarchical RAG for Cyber Threat Intelligence (H-RAG) 2025
Python, LangChain, FAISS, Sentence-BERT

- Designed hierarchical retrieval architecture with entity-based indexing and adaptive summarization for structured CTI corpora; benchmarked against flat RAG baselines. Presented at ICSDSA 2026.

PUBLICATIONS

PROFESSIONAL EXPERIENCE

AI and Data Engineering Intern, Ford Werke GmbH Sep 2024 to Mar 2025
Cologne, Germany

- Designed modular ML evaluation workflows using MLflow and Vertex AI integrations, ensuring full experiment reproducibility and automated model performance reporting.
- Implemented CI/CD pipelines (GitHub Actions, Azure DevOps) for automated data validation and schema checks, reducing reporting errors by 20%.
- Automated ETL evaluation workflows in BigQuery and Looker Studio, cutting manual verification overhead by 30%.

AI Research and Data Science Intern, AI Variant May 2023 to Aug 2023
Remote

- Conducted structured model evaluation research (ARIMA, LSTM, Random Forest) on sequential financial datasets with MLflow-based reproducibility tracking.
- Translated prototype findings into production-aligned data products and structured research documentation.

Graduate Trainee Engineer, Siemens AG Aug 2022 to Mar 2023
Bengaluru, India

- Executed 150+ test cases for Siemens PCS Neo; identified 40+ defects through systematic QA validation; built structured defect taxonomies and repeatable evaluation workflows.
- Developed Python-based automation tools for system diagnostics; coordinated Agile testing across international teams, reducing release delays by 20%.

TECHNICAL SKILLS

Programming	Python (primary), SQL, Bash, Git, PySpark; familiar with Java and JavaScript
MARL and RL	Graph Attention Networks, multi-agent coordination, partial observability, policy learning, zero-shot transfer, communication protocols
ML Frameworks	PyTorch, TensorFlow, scikit-learn, Hugging Face Transformers and Datasets, LangChain
LLM and NLP	Contrast-set benchmarking, pseudo-likelihood scoring, distribution-shift holdouts, RAG architecture, FAISS, Sentence-BERT
Evaluation Design	Ablation studies, error taxonomy design, interpretability (probing classifiers, attention diagnostics), zero-shot transfer protocols
MLOps	MLflow, Apache Airflow, GitHub Actions, Azure DevOps, CI/CD, experiment tracking, SLURM
Cloud and Data	GCP (Vertex AI, BigQuery, Cloud Run), Azure Data Factory, Databricks, AWS (basic)
Languages	English (Business Fluent, C1) | German (Elementary, A2) | Kannada and Telugu (Native)

Research Statement | PhD Application, PEARL Lab, TU Darmstadt

RESEARCH IDENTITY

My research sits at the intersection of structure-aware reinforcement learning, multi-agent coordination, and neuro-symbolic AI. I am drawn to the question that PEARL Lab's SIREN project frames with unusual clarity: what structured representations of the robot-environment system are necessary and sufficient for an agent to generalize beyond its training conditions? My work to date has approached this from the multi-agent side; I am motivated to extend it into embodied robot learning within SIREN's framework.

CURRENT WORK

My MSc thesis produced GatConvo, a graph-attention cooperative MARL framework for mixed-traffic autonomous driving under partial observability. The core design challenge is identical to one SIREN identifies as fundamental: agents must form structured, geometry-aware representations of a dynamic environment from incomplete local observations, and the resulting policies must transfer to deployment conditions not seen at training time. I implemented a zero-shot cross-scenario transfer protocol across five unseen traffic configurations without additional fine-tuning and built explainability modules to diagnose coordination failures under distribution shift. The work was submitted to IEEE Transactions on Intelligent Transportation Systems.

Two observations from GatConvo directly motivate my PhD research direction. First, graph-attention message passing is a powerful inductive bias, but the quality of structured environment representations fundamentally limits what coordination policies can learn. When relational structure is poorly captured, even well-designed RL objectives fail to produce robust behaviors. Second, zero-shot transfer works only when representations capture the physics and geometry of agent-environment interaction at the right level of abstraction. Both observations point toward the need for richer, physics-aware structured world models, precisely the focus of SIREN's first research pillar.

Alongside GatConvo, I developed VedaNet, a neuro-symbolic framework integrating structured logical constraints as symbolic inductive biases into language model inference. The five-layer pipeline enforces composable reasoning constraints at inference time without retraining, targeting EMNLP 2026. Though the domain is NLP, the underlying problem mirrors what Prof. Chalvatzaki identifies in embodied AI: how do you ground high-level semantic information onto structured properties of the system so that generalization scales, rather than depending on surface-level pattern matching?

RESEARCH VISION AT PEARL LAB

Within PERL, I want to pursue structure-aware RL for mobile manipulation, focusing on two open problems.

Structured world models as RL priors. Physics-aware structured dynamics models, learned from multisensory embodied streams, can serve as efficient priors for policy learning, reducing sample complexity and improving robustness under real-world uncertainty. PEARL Lab's recent work on domain randomization via entropy maximization (Tiboni et al., ICLR 2024) and robust adversarial RL (Reddi et al., ICLR 2024) defines the frontier here. I am interested in extending this line toward structured representations that make domain randomization less reliant on manually specified parameter ranges.

Long-horizon credit assignment in contact-rich tasks. GatConvo's multi-agent credit assignment under partial observability gave me direct experience with how structural constraints on communication topology improve credit propagation. I believe analogous inductive biases, grounded in robot kinematics, contact geometry, and affordance structure, can address the same bottleneck in single-robot long-horizon tasks. This connects naturally to SIREN's goal of uncertainty-aware, composable policies that generalize across challenging human-like environments.

WHY PEARL LAB

PEARL Lab is the right environment for this research because it treats structure not as an optional prior but as the organizing principle of robot learning. Prof. Chalvatzis’s framing of SIREN, robot and environment as a unified system governed by shared physics and information flow, matches how I understand the failures of black-box policies I observed in GatConvo. The combination of the ERC SIREN project, the EU Generative AI for Robotics Lighthouse initiative, and the Hessian.AI and RAI ecosystem offers a rare opportunity to work on foundational RL methodology while connecting it directly to real robot hardware and long-horizon embodied tasks.

I am committed to contributing rigorous, publishable research and to bringing the structure-first perspective I have developed in MARL into the embodied robot learning setting.
